

How to install Data Studio 4.1.x in Ubuntu 14.04

To run the installation with administrative privileges use the root user (which is the most probable):

```
sudo su
```

Inside the uncompressed directory:

If you are installing Data Studio with administrative privileges:

```
sh imLauncherLinux.sh
```

If you are installing Data Studio with no administrative privileges:

```
sh imLauncherLinuxUser.sh
```

Note: The New Database option doesn't work, so you must create the database from the command line.

Always before starting Data Studio make sure the DB2 database is started:

```
su db2inst1
```

Start the database:

```
db2start
```

```
10/08/2019 15:30:56  0  0  SQL1063N DB2START processing was successful.  
SQL1063N DB2START processing was successful.
```

If the database is already active:

```
db2start
```

```
10/08/2019 15:38:20  0  0  SQL1026N The database manager is already active
```
